

Bluestock Fintech — Data Analytics Research Report

Prepared for the Bluestock Fintech internship prerequisite

1. Company and product context

Bluestock describes itself as a mobile app for stock-market content, analytics and community. Its public site highlights IPO information, global indices, market insights, broker comparison and a market community.

2. Publicly visible data products

Area	Publicly described data	Analytics use case
IPO Data Feed	IPO pricing, timelines and financial information	Comparison, filtering, alerts and historical reporting
Indices	Index data including close, high, low and volume	Returns, trends, volatility and market summaries
Top Gainers / Losers	Market-movement data	Screening, rankings and monitoring
Market Events	IPOs, earnings and other events	Event calendars and alerts
Startup News	Funding, acquisitions and industry trends	Categorisation and trend analysis

3. Where a data analyst can contribute

A data analyst can work on data-quality checks, API datasets, KPI definitions, product-usage analysis, market-data summaries and reporting. For example, a product analyst could examine which features are used most often and whether a new feature changes engagement. A market-data analyst would also need to handle timestamps, missing observations, corporate actions and differences between end-of-day and real-time data.

4. Example business question

Question: Which market-content features are most useful to active users?

Approach: combine product-event logs with user segments, calculate feature adoption and weekly active users, then compare retention before and after feature changes. This is a proposed analytics workflow, not a claim about Bluestock's private internal data.

5. Key takeaway

Bluestock's public product pages show that financial data is central to its ecosystem. IPOs, indices, market events, gainers/losers and news all create structured datasets. This makes data accuracy, timely updates and clear metric definitions important parts of the customer experience.
